

## Bag it Movie

Whether you live in city or village there is no doubt that you have used bags for groceries or to carry other items. Plastic bags are everywhere you would see them thrown in the streets or sometimes flying in the air until they make their way into the ocean. Plastics bags are really dangerous for our environment because they release toxic chemicals to the soil and they even break down into the soil which cause death when animals eat them. Marine live also get effected from plastic bags when they make their way into the ocean. A lot of fish, turtles, and birds were found dead next to the ocean. When they envisage the cause of their death they found different types of plastic in their stomach.

Plastic is a big threat to our environment. We already saw the result of miss use plastic bags in wiled and marine lives and how animals are dying of eating plastic. If we don't change our behavior toward using plastic bags, we will be ended up polluting the ocean more and more which will result in more death of the marine live. We won't be able to eat fish because they would be poisoned from the toxic substances that release from plastic. Fishermen will lose their way of income and the tuna companies will be shut down and won't be able to produce and sale their products. They government will also be affected by losing the review that comes from those sources.

Since the bag it movie was release in 2010 the concern about plastic has being raised. A lot of companies start to recycle their plastic bottles and some companies buy they from people and send they overseas to be recycle or used to make new products.

If we delay taking action to prevent plastic to get into our ocean we will cause more damage to the marine live and cause more pollution to the ocean. Our eco system won't be sustainable and we will have more environmental issues in the near future.
